

diagram for keeping track of terms in part 2

Ian Chi

January 18, 2026

C is a subset that can be removed to get opt. it is of size $\varepsilon_f n$ where n is the size of the list.

δ big elements $i \in [n]$ and have another $j \in [n]$ such that $\frac{1}{2} - \delta$ percent of elements between i and j violate monotonicity.

Claim: opt requires removing exactly half of all 0-big

term	directional	can be in c	must be in c
δ big	n	y	n
high/low critical	y	y	n
left/right big	y	y	n

δ big implies it is either left or right big and vice versa.
