Yanakakis vs AGM

- When is Yanakakis faster than AGM?
- AGM only cares about shape of hypergraph
- Yanakakis is "aware" of the actual relations

- fractional edge cover = 5
 - AGM guarantees $O(n^5)$
- If in one of the relations R_i , there are no values. yanakakis will finish in $O(n)$.
- if R_i is the root node, the bottom up phase removes nothing (R_i has nothing to remove) and the top down phase removes everything in $O(n)$
